

## CASE STUDY CS369

**PROJECT:** Regulatory Disposal of Waste Chemicals

**CLIENT:** Factory Owner, East Midlands

**DURATION:** 4 weeks

**COST RANGE:** Less than £5k

**STATUS:** Completed and Validated

### WORKS

- Analysis of drum contents to identify chemicals.
- Examination of containers to ensure that they could be transported safely.
- Location of approved waste facility.
- Containers transported to approved facility.
- Paperwork provided to relevant parties for inspection by regulatory authorities

### SYNOPSIS

The factory owner had inherited a number of containers, ranging from large metal drums to small plastic containers, which had been abandoned by the previous occupier following failure of their parent company. TRM provided advice on the regulatory disposal of the containers.

The contents of each container were analysed to determine their chemical and physical properties, which in turn allowed their respective waste classification and subsequent removal to approved waste facility.

Following an inspection of the structural integrity of each container, the containers were transported safely to a waste management facility under the TRM Waste Carrier Licence and regulatory Consignment Note provided.
